Valiant Verification SDK

Windows Setup Guide

This gets you from nothing to a working **valiant** gate on a Windows machine in four short steps. Commands are pasted into **PowerShell**.

What you need first

- **Node 18 or newer** — download from https://nodejs.org (the LTS installer is fine).
- **A Morpheus account** — the free 14-day trial licence is issued to this account; you sign in with Google.

STEP 1 · INSTALL THE SDK

Open **PowerShell** and run:

```
npm install -g "https://api.morpheus.nz/api/functions/getPackage?name=valiant-verification-sdk&version=latest"
```

This installs the `valiant` command. Nothing else is downloaded.

STEP 2 · GET YOUR FREE TRIAL LICENCE

1. Go to https://morpheus.nz/licences
2. Sign in with Google.
3. Press **Start trial**.
4. Copy the token it shows — one line beginning `vvs1…`.

STEP 3 · PUT THE LICENCE ON THIS MACHINE

In PowerShell, paste the two lines below — replace `vvs1…` with the token you copied in Step 2:

```
New-Item -ItemType Directory -Force "$env:USERPROFILE\.valiant" | Out-Null
Set-Content "$env:USERPROFILE\.valiant\licence" "vvs1…" -NoNewline
```

The licence is saved to a hidden `.valiant` folder in your user profile, in a file called `licence` (no extension).

> **It is checked offline.** Once the file is in place there is no account, no login and no network call — `valiant` reads that file and trusts its signature.

STEP 4 · FIRST RUN

Change into your repository and run:

```
cd C:\path\to\your-repo
valiant setup
```

`setup` writes `valiant.json` (the only file it adds), proposes a guard, proves it can fail, and runs the gate.

Check it worked

```
valiant licence --status
```

You should see `licence OK`, your plan, seat count and expiry date.

Using it with an AI agent (Grok, Claude, Cursor, …)

An agent just runs `valiant` like any other command — the licence is already in place, so there is nothing extra to configure. If the agent is asked to gate a repository, the commands it needs are:

```
valiant gate        # the verdict
valiant verify      # the full proof
```

Already have a licence file instead?

```
valiant licence --file C:\path\to\your-licence.licence
```

Troubleshooting

You see	It means
`'valiant' is not recognized`	the install did not put `valiant` on PATH — close and reopen PowerShell, or re-run Step 1.
`gate needs a licence on this machine`	Step 3 was missed or the token is wrong — re-paste it.
`licence expired …`	the trial or subscription lapsed — renew at morpheus.nz/licences.
